

iPhone Sales Analytics Dataset

The iPhone Sales Dataset is a structured business dataset that represents smartphone sales transactions across multiple countries and customers. It provides comprehensive information related to Apple iPhone sales, including product specifications, customer purchasing records, transaction values, and payment details. This dataset is highly useful for performing sales analysis, customer behavior analysis, trend forecasting, and interactive dashboard creation. The dataset simulates real-world retail and e-commerce sales operations where different iPhone models are sold with varying storage capacities, colors, quantities, and prices. Each row in the dataset represents a unique sales transaction, making it ideal for analytical and reporting purposes.
